        New plant protein having endo-chitinase activity - used in antifungal compans. and to develop transformed plants which are less susceptible to fungal infection.

Claim 3; Page 19-20; 43pp; English.

Screening of a lambda ZAP cDNA library of TMV-infected Samsunn NN tobacco plants with a probe derived from PROB40 (a partial Cluster-A cDNA clone) resulted in the isolated of 11 positively hybridising clones. Analysis revealed that all were identical and corresp. to Cluster-A cDNA. The nt sequence of clone cA-3 is given in 082973/R70025. This clone lacks 7 codons of the 5' part of the order. The CDNA clone was completed by performing a PCR reaction on clone cA-3 with primer T7 (082794) and primer P1 (08275). A partial AA with primer T7 (082794) and primer P1 (08275). A partial AA

             New plant protein having endo-chitinase activity - used in antifungal compsns. and to develop transformed plants which are less susceptible to fungal infection.

Claim 3; Page 25-28; 43pp; English.

Screening of lambda ZAP cDNA library of TMV-infected Samsunn NN cobacco plants with a probe derived from PROB40 (a partial Cluster-cDNA clone) resulted in the isolated of 11 positively hybridising clones. Analysis revealed that all were identical and corresp. to cluster-A cDNA. The sequence of CDNA clone cA-3 is given in 082973/ R70025. A genomic library of N. tabacum was screened using the Cluster-A cDNA insert of clone cA-3 as a probe (see 082977, 082978) The complete nt. sequence of Cluster-A cDNA including the deduced primary structure of the Cluster-A protein the 5' and 3' UTR region

The Cluster-A precursor protien contains a putative signal peptide as well as 4 potential N-linked glycosylation sites (N-X-S/T). The predicted mature protein has a calculated mol. wt. of 39,033 Da. Disclosure and Claim 8; Page 39-40; 64pp; French.
The sequence coding for wheat germin, a protein induced during germination of wheat, is a preferred example of DNA coding for a protein able to degrade oxalic acid. Such DNA can be coupled to a sequence of interest, e.g. one coding for enzymes which confer resistance to pathogens (esp. endochitinases). Plant calli which have been successfully transformed by the sequence of a mature endochitinase; the sequence was previously disclosed in EP-531218.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (SNFI ) ELF SANOFI.

Three probes were designed based on the CH3C sequence, corresponding to the start, middle and downstream regions of the coding sequence of A. album endochitinase from an A. album cDNA library in p7219R. A 1.6kb fragment was identified in several positive clones. The sequence of the fragment contained an ORF encoding a 423 amino acid protein. The mature endochitinase can be used to control pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           06-SEP-1991; FR-0110/2.

Chitin biosynthetic enzymes end I, exo I and exo II - are periplasmic chito:dextrinase(s), periplasmic beta-GlcNAcidase(s) aryl beta-N-acety:gluco:amidase(s), respectively example 4; Page 79-82; 101pp; English.

Periplasmic chitodextrinase (W02156), periplasmic Beta-N-acety1glucosaminidase (W02157) and aryl Beta-N-acety1glucosaminidase (W02158) can be used to produce chitologoaccharides with the structure (GlcNAc)n where n is 2 or

Disclosure; Fig. 1A-1C; 20pp; English.

Serratia marcescens QMB1466 genomic DNA was partially digested,

Ligated into vector pLAFR1, packaged into lambda phage particles,
and used to transfect Escherichia coli DH1 (ATCC 33849) cells;

Plating on chitin medium was used to screen for chitinase activity.

Clone C12 (ATCC 67152) was isolated. Its sequence is given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              18-JUL-1986;

Disclosure; Fig.1; 13pp; English.
Plasmid pCHIT1251 containing the chitinase-A gene (chiA), fused directly to a nos promoter, may be used to transform, via Agrobacterium sp., a crop plant. The resulting transgenic plants expressing the chitinase-A protein fragment are protected against fungi, nematodes, insects and disease agents. The protein is preferably expressed by the plant only at the site of pathogen attack, e.g. only in the root cells. The plants express the chitinase in a biologically active form.

                                                                                                                                                                                                                                                                                periplasmic chito:dextrinase(s), periplasmic beta-GlcNAcidase(s) and aryl beta-N-acetyl:gluco:amidase(s), respectively Claim 2; Page 68-71; 101pp; English.

Periplasmic chitodextrinase (W02156), periplasmic Beta-N-acetylglucosaminidase (W02157) and aryl Beta-N-acetylglucosaminidase (W02158) can be used to produce chitin oligosaccharides with the structure (GlcNac)n where n is 2 or higher, by contacting them with soluble chitin. The enzymes are encoded by the genes endI, exoI and exoII respectively. They are all genes involved in the catabolic pathway of chitin.

8:part8 9:part9 10:part10 11:part11

Statistics: Mean 50.039; Variance 84.025; scale 0.596

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
